/ncce="Occasion: mixed (see below); Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI: Equal amounts of plaamid DNA from three normalized libraries (melanocyte 2NbHM, pregnant uterus NbHPU, and fetal heart NbHH19W) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 340488-345479, and 484488-489479."

pCMV-SPORT6; Site_1: Not1; Site_2: EcoRV (destroyed); RNA
source anonymous pool of spleen and pancreas from 28 yo
male. Library is oligo-dT primed and directionally cloned
(EcoRV site is destroyed upon cloning). Average insert
size 1:5 kb, insert size range 1-2.5 kb. Library is
normalized and enriched for full-length clones and was
constructed by C. Gruber (Invitrogen). Research Genetics

polylinker; Site_1: Not i; Site_2: Eco RI; The
NIH_BMAP_M.S3.2 library is a subtracted library of the mouse
brain (cerebellum, brain stems, olfactory bulbs,
hypothalamus, cortex, amygdala, basal ganglia, pineal
gland, striatum, hipoccampus) after a series of
subtractions to reduce the representation of CDNAs from
which ESTS had already been generated in this
process: NIH_BMAP_MS3.2, NIH_BMAP_MS2, NIH_BMAP_MS1.
The subtracted library (NIH_BMAP_MS2, NIH_BMAP_MS2)
as follows: PCRamplified cDNA inserts from NIH_BMAP_MS2
clones from which 3' ESTS had been derived was used as a
driver in a hypbridization with the NIH_BMAP_MS2 library
in the form of single-stranded clibrary) was purified
shiph hydroxyapatite column chromorated library) was purified
shiph-arranded clicles (subtracted library) was purified
shiph-arranded clicles (subtracted library) was purified
              Email: mEST@mail.nih.gov
The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized pineal glands library CDNA Library Preparation: M.B. soares Lab Clone distribution: NIH BMAP cDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lennon and Soares, Genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BE690327

The sequence contained an oligo-dT track that was present in the oligouncleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the Not1 site and the oligo-dT track served to verify it as a clone from the non-normalized ovary at estrus day 12 library CDNA Library Preparation: RJ Woods, JA Green, RS Prather S142 Animal Science Research Center, Department of Animal Science, University of Missouri-Columbia, 5221 Clone distribution: olones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this cDNA sequence: 1-28, Seq primer: M13 Forward
POUXA-Yes.

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

/note="Vector: pluescript SK: Site_1: SalI; Site_2: NotI;
Cambial region tissues, including developing and mature meristematic cambial zone and the developing and mature philoem, was harvested from 1.5 m actively growing trees.
CDNA was prepared and cloned into lambda 9t22a. DNA was isolated and subcloned into pBluescript SK using SalI and NotI restriction enzymes."

NotI restriction enzymes."

/note="Vector: pBlueScript II (SK-); Site_1: ECORV; C.
parvum (IOWA isolate) genomic DNA was hydrodynamically sheared to produce fragments having a tight size distribution between 2-4 kb by Dr. Yvonne Thorstenson of the Stanford DNA Sequencing and Technology Center (http://sequence-www.stanford.edu/group/techdev/shear.htm)
/ The randomly sheared gDNA was chromatographed on Sephacryl S-400 to remove any small fragments and DNA eluting in the void volume was subcloned into an ECOR V-digested, alkaline phosphatase-treated pBlueScript II (SK-) vector and transformed into E. coli strain XL2 Blue MRF'. Recombinant clones from the first plating of the library were selected for sequence analysis using T3 and T7 primers."
